Some of the issues I saw from the other course websites was the lack of identification for which page you needed to go a get specific information of lack there of. The problems I just outlined have an impact on the student experience because either the website does not have enough information or the information is cluttered and hard to find. Redesigned the course website to be outlined specifically for every individual item we thought was necessary for it. Not necessarily going for the looks of a website but the overall feel that you get navigating through it. We took all the information from both provided representations and figured what was best from each of them and tried to implement them which made the most sense. Some of the challenges we faced was how to set up the website, we ultimately decided to split it into separate pages on the header with a drop-down menu. Another challenge faced was to make sure it was 100 percent responsive. Which required me to go through every property in the CSS files and change them to respectively to a system which will make the responsive design easier. I decided myself to use media queries to transform the header properly by increasing height of header to account for the size of the screen getting smaller and the inline-block element for the lists in the header div.
